

Commands	Description	CLI Mode
ip access-list {standard <access-list-number (1-1000)=""> extended <access-list-number (1001-65535)=""> } Available options: • standard <access-list-number (1-1000)=""> - Configures a Standard access-list with the specified access list number. Standard access lists create filters based on IP address and network mask only (L3 filters only). This value ranges from 1 to 1000. • extended <access-list-number (1001-65535)=""> - Configures an Extended access-list with the specified access list number. Extended access lists enables specification of filters based on the type of protocol, range of TCP/UDP ports as well as the IP address and network mask (Layer 4 filters). This value ranges from 1001 to 65535.</access-list-number></access-list-number></access-list-number></access-list-number>	Configures IP ACLs and enters into the standard or extended Access-list configuration mode. Depending on the standard or extended option chosen by the user, this command returns a corresponding IP Access list configuration mode. ACLs on the system perform both access control and Layer 3 field classification.	Global Configuration
Available options: • ip - Configures the Egress access-list mode as IP which supports IP based PCL(Policy Control List) at egress • mac - Configures the Egress access-list mode as MAC which supports MAC based PCL(Policy Control List) at egress. Note: existing access list configurations should be deleted before setting Egress Filter Mode as IP.	Configures the default egress access-list mode as IP based or MAC based.	Global Configuration
permit {any host <src-ip-address> </src-ip-address>	Configures the packets to be forwarded depending on the associated parameters.	Standard IP ACL Configuration

•		ss> <network-src-ip><mask></mask></network-src-ip>		
		ies the source IP address. The		
		IP can be:		
	Jource	ii dair bo.		

1	-
Configures traffic for a particular protocol packet if the conditions defined in the permit statement are matched.	Extended IP ACL Configuration
	for a particular protocol packet if the conditions defined in the permit statement

- any|host <src-ipaddress>|<network-src-ip><mask>
 Specifies the source IP address. The source IP address can be:
 - any Packets from any source are matched.
 - host <src-ip-address> -Packets from this IPv4 source address are matched.
 - o <network-src-ip> <mask>
 - Packets are matched using this source IPv4 network and mask.
 - mask to use with the source IP address
- any|host <dest-ipaddress>|<networkdest-ip><mask> - Specifies the destination IP address. The destination IP can be:
 - any Packets to any destination are matched
 - host <src-ip-address> Packets for this IPv4 destination address are matched
 - o <network-src-ip> <mask>
 - Packets are matched using this destination IPv4 network and mask.
- tos Matches the protocol packets based on the following type of service configuration: The options are:
 - max-reliability- Matches the protocol packets having TOS field set as high reliability.
 - max-throughput Matches the protocol packets having TOS field set as high throughput.
 - min-delay-Matches the protocol packets having TOS field set as low delay.
 - normal Allows all protocol packets. Does not check for the TOS field in the packets.
 - o <value (0-7)>- Matches the protocol packets based on the TOS value set. This value ranges from 0 to 7.
- dscp <value (0-63)> Configures
 the Differentiated Services Code Point
 value to be checked against the packet,
 This value provides the quality of service
 control. This value ranges from 0 to 63.

redirect - Redirects the packets to the destination interface or set of interfaces.		
filter rules. Lower value implies a higher priority. This value ranges from 1 to 255. deny {ip ospf pim <protocol-< td=""><td>Denies traffic for a</td><td>Extended IP</td></protocol-<>	Denies traffic for a	Extended IP

Available options:
       any|host <src-ip-
        address>|<network-src-ip><mask>
        - Specifies the source IP address. The
        source IP can be:
           o any - Packets from any source
                are matched.
                host <src-ip-address> -
                Packets from this IPv4 source
                address are matched.
                <network-src-ip> <mask>
                - Packets are matched using this
                source IPv4 network and mask.
        Matches the TCP packets having the TCP
        source port numbers greater than the
        specified port number. This value ranges
        from 1 to 65535.
        lt <port-number (1-65535)> -
        Matches the TCP packets having the TCP
        source port numbers less than the
        specified port number. This value ranges
        from 1 to 65535.
       eg <port-number (1-65535)> -
        Matches the TCP packets having the TCP
        source port numbers equal to specified
        port number. This value ranges from 1 to
        65535.
        range <port-number (1-65535) >
        <port-number (1-65535)>-
        Matches the TCP packets having the TCP
        source port numbers within the specified
        range. This value ranges from 1 to 65535.
        This value specifies the minimum port
        number and the maximum port number
        values.
       any|host <dest-ip-
        address>|<network-
                            - Specifies the
        source IP address. The source IP address
        can be:
```

o any - Packets to any destination

host <src-ip-address> = Packets for this IPv4 destination

<network-src-ip> <mask>
- Packets are matched using

address are matched

are matched

this destination IPv4 network and mask.

- gt <port-number (1-65535)> Matches the TCP packets having the TCP destination port numbers greater than the specified port number. This value ranges from 1 to 65535.
- 1t <port-number (1-65535)> Matches the TCP packets having the TCP
 destination port numbers less than the
 specified port number. This value ranges
 from 1 to 65535.
- eq <port-number (1-65535) > Matches the TCP packets having the TCP destination port numbers equal to specified port number. This value ranges from 1 to 65535.
- range <port-number (1-65535)>
 <port-number (1-65535)>-

Matches the TCP packets having the TCP destination port numbers within the specified range. This value ranges from 1 to 65535. This value specifies the minimum port number and the maximum port number values.

- ack Matches TCP packets with the TCP ACK bit set.
- rst Matches TCP packets with the TCP RST bit set.
- tos Matches the TCP packets based on the following type of service configuration: The options are:
 - max-reliability- Matches the TCP packets having TOS field set as high reliability.
 - max-throughput Matches the TCP packets having TOS field set as high throughput.
 - min-delay-Matches the protocol TCP having TOS field set as low delay.
 - normal Allows all TCP packets. Does not check for the TOS field in the packets.
 - <value (0-7) >- Matches the TCP packets based on the TOS value set. This value ranges from 0 to 7.
- dscp <value (0-63)> Configures
 the Differentiated Services Code Point
 value to be checked against the packet,
 This value provides the quality of service
 control. This value ranges from 0 to 63.

priority <value (1-255)=""> - Configures the priority of the filter to decide which filter rule is applicable when the packet matches with more than one filter rules. Lower value of 'filter priority' implies a higher priority. This value ranges from 1 to 255</value>

Extended IP ACL Configuration

UDP source port numbers equal to specified port number. This value ranges from 1 to 65535.

- range <port-number (1-65535)> <port-number (1-65535)>-
 - Matches the UDP packets having the UDP source port numbers within the specified range. This value ranges from 1 to 65535. This value specifies the minimum port number and the maximum port number values.
- any|host <dest-ipaddress>|<networkdest-ip><mask> - Specifies the source IP address. The source IP address can be:
 - any Packets to any destination are matched
 - host <src-ip-address> Packets for this IPv4 destination address are matched
 - o <network-src-ip> <mask>
 - Packets are matched using this destination IPv4 network and mask.
- gt <port-number (1-65335) > Matches the UDP packets having the UDP destination port numbers greater than the specified port number. This value ranges from 1 to 65535.
- 1t <port-number (1-65535) > Matches the UDP packets having the UDP destination port numbers less than the specified port number. This value ranges from 1 to 65535.
- eq <port-number (1-65535) > Matches the UDP packets having the UDP destination port numbers equal to specified port number. This value ranges from 1 to 65535.
- range <port-number (1-65535)> <port-number (1-65535)>-

Matches the UDP packets having the UDP destination port numbers within the specified range. This value ranges from 1 to 65535. This value specifies the minimum port number and the maximum port number values.

 tos - Matches the UDP packets based on the following type of service configuration: The options are:

- max-reliability- Matches the UDP packets having TOS field set as high reliability.
- max-throughput Matches the UDP packets having TOS field set as high throughput.
- min-delay-Matches the UDP packets having TOS field set as low delay.
- normal Allows all UDP packets. Does not check for the TOS field in the packets.
- o <value (0-7) >- Matches the UDP packets based on the TOS value set. This value ranges from 0 to 7.
- dscp <value (0-63)> Configures the Differentiated Services Code Point value to be checked against the packet, This value provides the quality of service control. This value ranges from 0 to 63.
- redirect Redirects the packets to the destination interface or set of interfaces.
 - <iftype>- Redirects the packets to the specified type of interface.
 - o <ifnum>- Redirects the packets to the specified interface identifier. This is a unique value that represents the specific interface. This value is a combination of slot number and port number separated by a slash, for interface types gigabitethernet, fastethernet and extreme-ethernet.
- sub-action Configures the VLAN specific sub action to be performed on the packet. Options are:
 - none Specifies that the actions related to the VLAN ID will not be considered.
 - modify-vlan <short (1-4094)> - Modifies the VLAN ID to which the packet gets classified. The packet could be an untagged or VLAN tagged packet. This value ranges from 1 to 4094.
- priority <value (1-255) > Configures the priority of the filter to

decide which filter rule is applicable when the packet matches with more than one filter rules. Lower value of 'filter priority' implies a higher priority. This value ranges from 1 to 255.

o host <src-ip-address> =</src-ip-address>	
Packets for this IPv4 destination	
address are matched	
o <network-src-ip> <mask></mask></network-src-ip>	
 Packets are matched using 	
this destination IPv4 network and	
mask.	
• message-type <short (0-255)=""> -</short>	
Configures the ICMP Message type to be	
checked against the packet. The packet is	
allowed if it matches with the message	
type. This value ranges from 0 to 255.	
Some of the ICMP message types are:	
o 0 Echo reply	
 3 Destination unreachable 	
 4 Source quench 	
o 5 Redirect	
8 Echo request11 Time exceeded	
11 Time exceeded12 Parameter problem	
 12 Farameter problem 13 Timestamp request 	
 14 Timestamp reply 	
 15 Information request 	
 16 Information reply 	
 17 Address mask request 	
 18 Address mask reply 	
o 255 No ICMP type	
• message-code <short (0-255)=""> =</short>	
Configures the ICMP Message code to be	
checked against the packet. The packet is allowed if it matches with the message	
code. This value ranges from 0 to 255.	
Some of the ICMP message Codes are:	
0 Network unreachable	
 1 Host unreachable 	
 2 Protocol unreachable 	
 3 Port unreachable 	
 4 Fragment need 	
 5 Source route fail 	
 6 Destination network 	
unknown o 7 Destination host unknown	
 8 Source host isolated 	
 9 Destination network 	
administratively prohibited	
 10 Destination host 	
administratively prohibited	
 11 Network unreachable TOS 	
 12 Host unreachable TOS 	
o 255 No ICMP code	
 redirect - Redirects the packets to the 	

destination interface or set of interfaces.

0	<iftype>- Redirects the packets to the specified type of interface.</iftype>	
0	<ifnum>- Redirects the packets</ifnum>	
	to the specified interface	
	identifier. This is a unique value	
	that represents the specific	
	interface. This value is a	
	combination of slot number and	
	port number separated by a slash, for interface types	
	gigabitethernet, fastethernet and	
	extreme-ethernet.	
	tion - Configures the VLAN	
	sub action to be performed on the	
	Options are:	
0	none - Specifies that the	
	actions related to the VLAN ID will not be considered.	
	modify-vlan <short (1-<="" th=""><th></th></short>	
	4094) > - Modifies the VLAN	
	ID to which the packet gets	
	classified. The packet could be	
	an untagged or VLAN tagged	
	packet. This value ranges from 1	
	to 4094.	
0		
	ty <value(1-255)> -</value(1-255)>	
	res the priority of the filter to	
	which filter rule is applicable when	
·	tet matches with more than one es. Lower value of 'filter priority'	
	a higher priority. This value	
	rom 1 to 255.
